

Coalgebra, Automata, and Document Synchronization

Kazuhiro Inaba

Reading “Merging Hierarchically-Structured Documents in Workflow Systems”

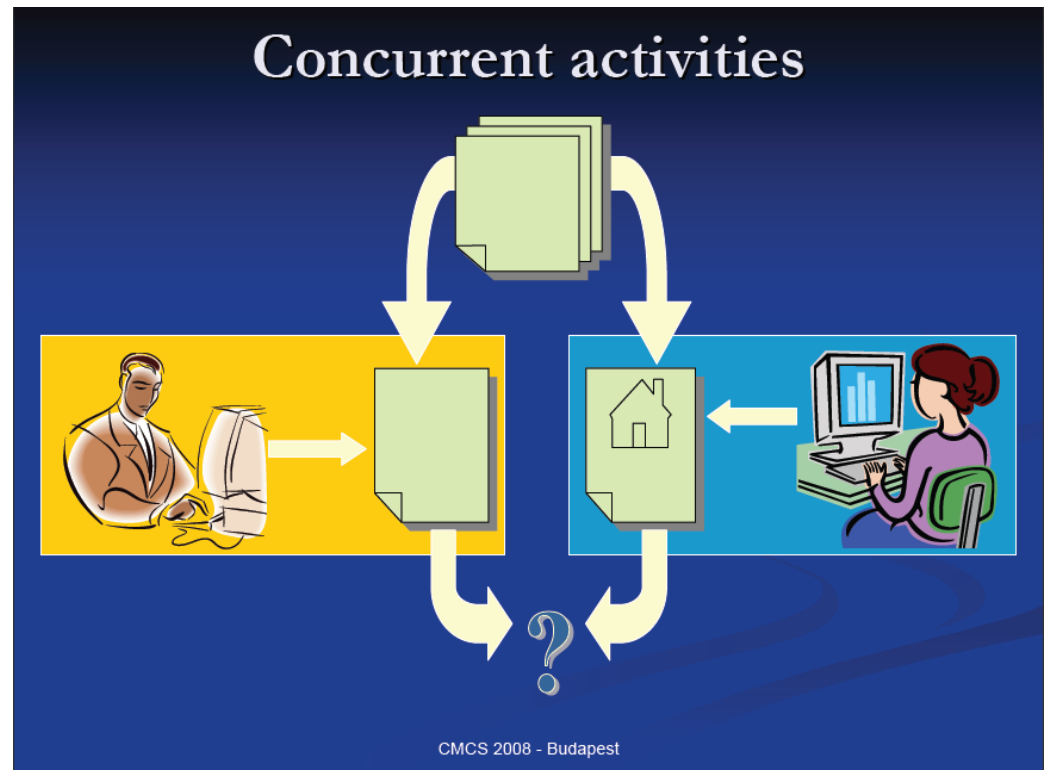

[E. Badouel and M. T. Tchendji, CMCS’08]

- ((All pictures are cited from the authors presentation slide: <http://old-www.cwi.nl/projects/cmcs08/slides/index.html> thanks.))

« Problem »

- Partial views of a (big) document
- Concurrently updated

- **How to merge them?**

Approach of this paper

- **Use coalgebra (= tree automaton)!**

Concurrent activities

CM

Basic Notions

- Document
- View
 - Projection
 - Expansion
- Grammar

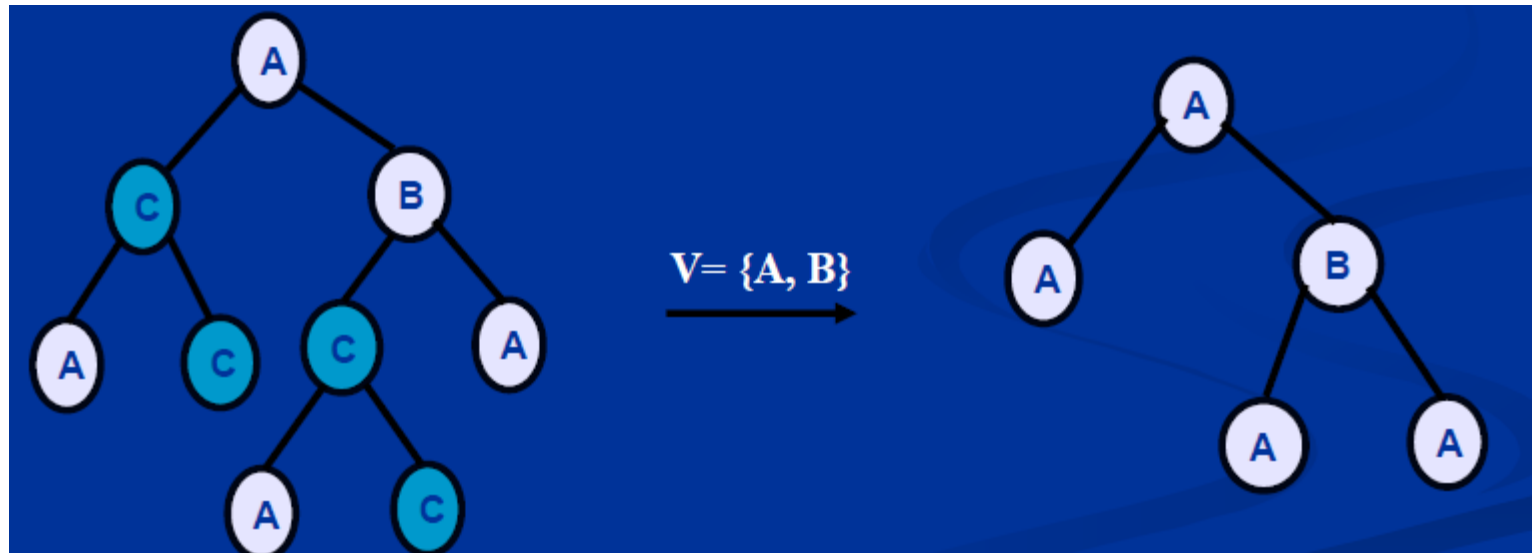

(Untyped) Document

- Let S be a finite alphabet
 - E.g. $S = \{A, B, C\}$
- A “document” (over S) is an unranked tree over S

(Untyped) View

- A “view” is a subset of S
- The “projection associated with a view” is the function (of type: tree \rightarrow forest) that erases all symbols not in the view

(Untyped) Expansion

- The “expansion associated with a view” is the function (of type: forest $\rightarrow 2^{\text{tree}}$) which is the inverse of the projection
 - Note: the output set is regular!
→ they’re represented as a tree automaton
 - How precisely? Wait a moment...

Grammar

- In the paper, the authors consider only “typed” documents.
 - Typed = Conformance to a grammar
- A “Grammar” over S is a triple (S, A, P) :
 - $A \in S$ axiom (initial symbol)
 - $P \subseteq S \times S^*$ set of productions

(Typed) Document

- A grammar $G = (S, A, P)$ corresponds to a set of trees called “derivation trees”, defined for each $X \in S$ as follows:
 - $\text{Der}(G, X) = \{X(t_1, \dots, t_n) \mid \exists X \rightarrow X_1 \dots X_n \in P: \forall i: t_i \in \text{Der}(G, X_i)\}$
- The members of $\text{Der}(G, A)$ are the document confirming the grammar G
- From now on, we deal with such docs only

Example of a Grammar & a Doc.

$p_1 : A \rightarrow C B$

$p_3 : B \rightarrow C A$

$p_5 : C \rightarrow A C$

$p_7 : C \rightarrow \epsilon$

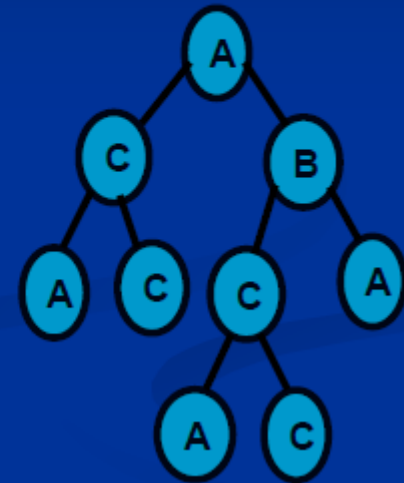

$p_2 : A \rightarrow \epsilon$

$p_4 : B \rightarrow B B$

$p_6 : C \rightarrow C C$

T

(Typed) View

- Same as before
 - A “view” $\subseteq \mathcal{S}$, “projection” is an erasure
- “expansion” takes two more parameters
 - $G = (\mathcal{S}, A, P)$: Grammar
 - $X \in \mathcal{S}$: Axiom
- $\text{expansion}(V, ts, G, X)$ returns the set of trees in $\text{Der}(G, X)$ whose projection with V are equal to ts

Example of an Expansion

$p_1 : A \rightarrow C B$

$p_3 : B \rightarrow C A$

$p_5 : C \rightarrow A C$

$p_7 : C \rightarrow \varepsilon$

$p_2 : A \rightarrow \varepsilon$

$p_4 : B \rightarrow B B$

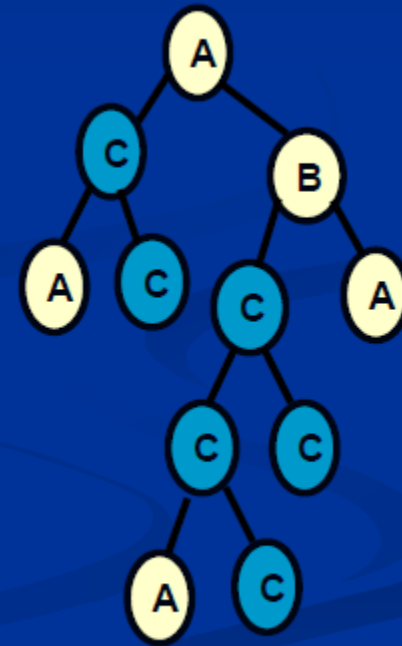

$p_6 : C \rightarrow C C$

A partial view

...

...

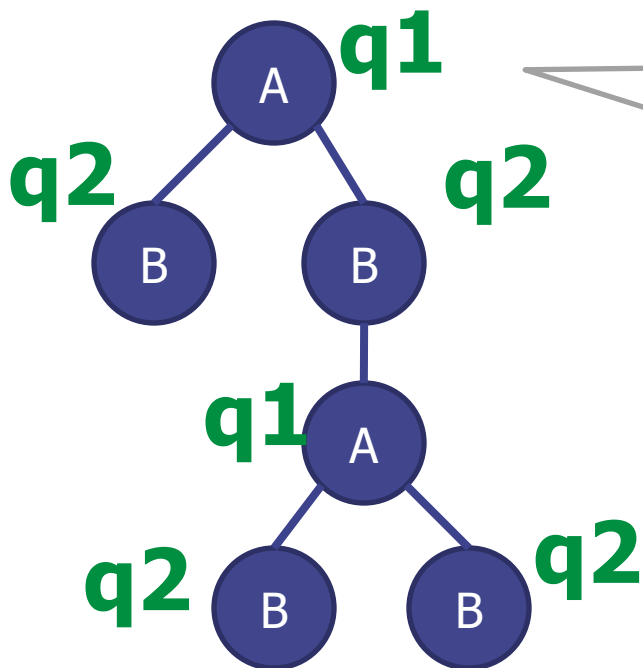

Its expansion

Tree Automata

- Tree Automaton \mathcal{A} is a tuple $\langle S, Q, \delta \rangle$:
 - S : node labels
 - Q : set of states
 - $\delta : Q \rightarrow 2^{S \times Q^*}$: transition relation
- Grammars are straightforwardly converted to tree automata: $G = (S, A, P) \rightsquigarrow$
 - $\mathcal{A} = (S, Q, \delta)$ where
 - $Q = S$
 - $\delta(q) = \{(q, q_1 \dots q_n) \mid q \rightarrow q_1 \dots q_n \in P\}$

Example

- $\mathcal{A} = (\{A,B\}, \{q1,q2\}, \delta)$
 - $\delta(q1) = \{ (A, q1q2), (A, q2q2) \}$
 - $\delta(q2) = \{ (B,), (B, q1) \}$

This tree is in the set of trees repr'd by $(\mathcal{A}, q1)$!

This tree is not!
(no possible assignment)

Representing Expansions by TA

- Recall:
 - expansion(**V**, **ts**, **G**, **X**) returns the set of trees in $\text{Der}(G, X)$ whose projection by V are equal to ts .
 - **V** \subseteq \mathcal{S}
 - **G** = (**S**, **P**)

Input: $V, G=(S, P), ts$

Output: the corresponding automaton

- Corresponding automaton is $\mathcal{A} = (S, Q, \delta)$:
 - $Q = S \times \underline{I}$ \underline{I} is the list of subtrees of ts
 - $\delta(\langle s, \underline{t} \rangle) =$
 - \emptyset if $s \in V$ and $\underline{t} \neq [s(\dots)]$
 - $\{ (s, \langle s_1, \underline{t}_1 \rangle \langle s_2, \underline{t}_2 \rangle \dots \langle s_n, \underline{t}_n \rangle) \mid$
 $s \rightarrow s_1 \dots s_n \in P,$
 $\underline{t}_1' \dots \underline{t}_n' = \underline{t}'$
 $\}$
if $s \in V$ and $\underline{t} = [s(\underline{t}')]$
or $s \notin V$ and $\underline{t} = \underline{t}'$

Proposition (Correctness)

- Member of $\text{expansion}(V, ts, G, X)$

iff

- Accepted by the automaton A from the state $\langle X, ts \rangle$

Example

- $S = \{A, B, C\}$
- $G = (S, A, P)$ where P is:

$p_1 : A \rightarrow C B$	$p_3 : B \rightarrow C A$	$p_5 : C \rightarrow A C$	$p_7 : C \rightarrow \varepsilon$
$p_2 : A \rightarrow \varepsilon$	$p_4 : B \rightarrow B B$	$p_6 : C \rightarrow C C$	

- $V = \{A, B\}$
- $ts =$

$p_1 : A \rightarrow C B$

$p_3 : B \rightarrow C A$

$p_5 : C \rightarrow A C$

$p_7 : C \rightarrow \varepsilon$

$p_2 : A \rightarrow \varepsilon$

$p_4 : B \rightarrow B B$

$p_6 : C \rightarrow C C$

- $\delta(\langle A, \mathbf{A(A, B(A, A))} \rangle) = \{$
 $(A, \langle C, \mathbf{A, B(A, A)} \rangle \langle B, \varepsilon \rangle),$
 $(A, \langle C, \mathbf{A} \rangle \langle B, \mathbf{B(A, A)} \rangle),$
 $(A, \langle C, \varepsilon \rangle \langle B, \mathbf{A, B(A, A)} \rangle) \}$
- $\delta(\langle C, \mathbf{A, B(A, A)} \rangle) = \{$
 $(C, \langle A, \mathbf{A, B(A, A)} \rangle \langle C, \varepsilon \rangle),$
 $(C, \langle A, \mathbf{A} \rangle \langle C, \mathbf{B(A, A)} \rangle),$
 $(C, \langle A, \varepsilon \rangle \langle C, \mathbf{A, B(A, A)} \rangle),$
 $(C, \langle C, \mathbf{A, B(A, A)} \rangle \langle C, \varepsilon \rangle),$
 $(C, \langle C, \mathbf{A} \rangle \langle C, \mathbf{B(A, A)} \rangle),$
 $(C, \langle C, \varepsilon \rangle \langle C, \mathbf{A, B(A, A)} \rangle) \}$

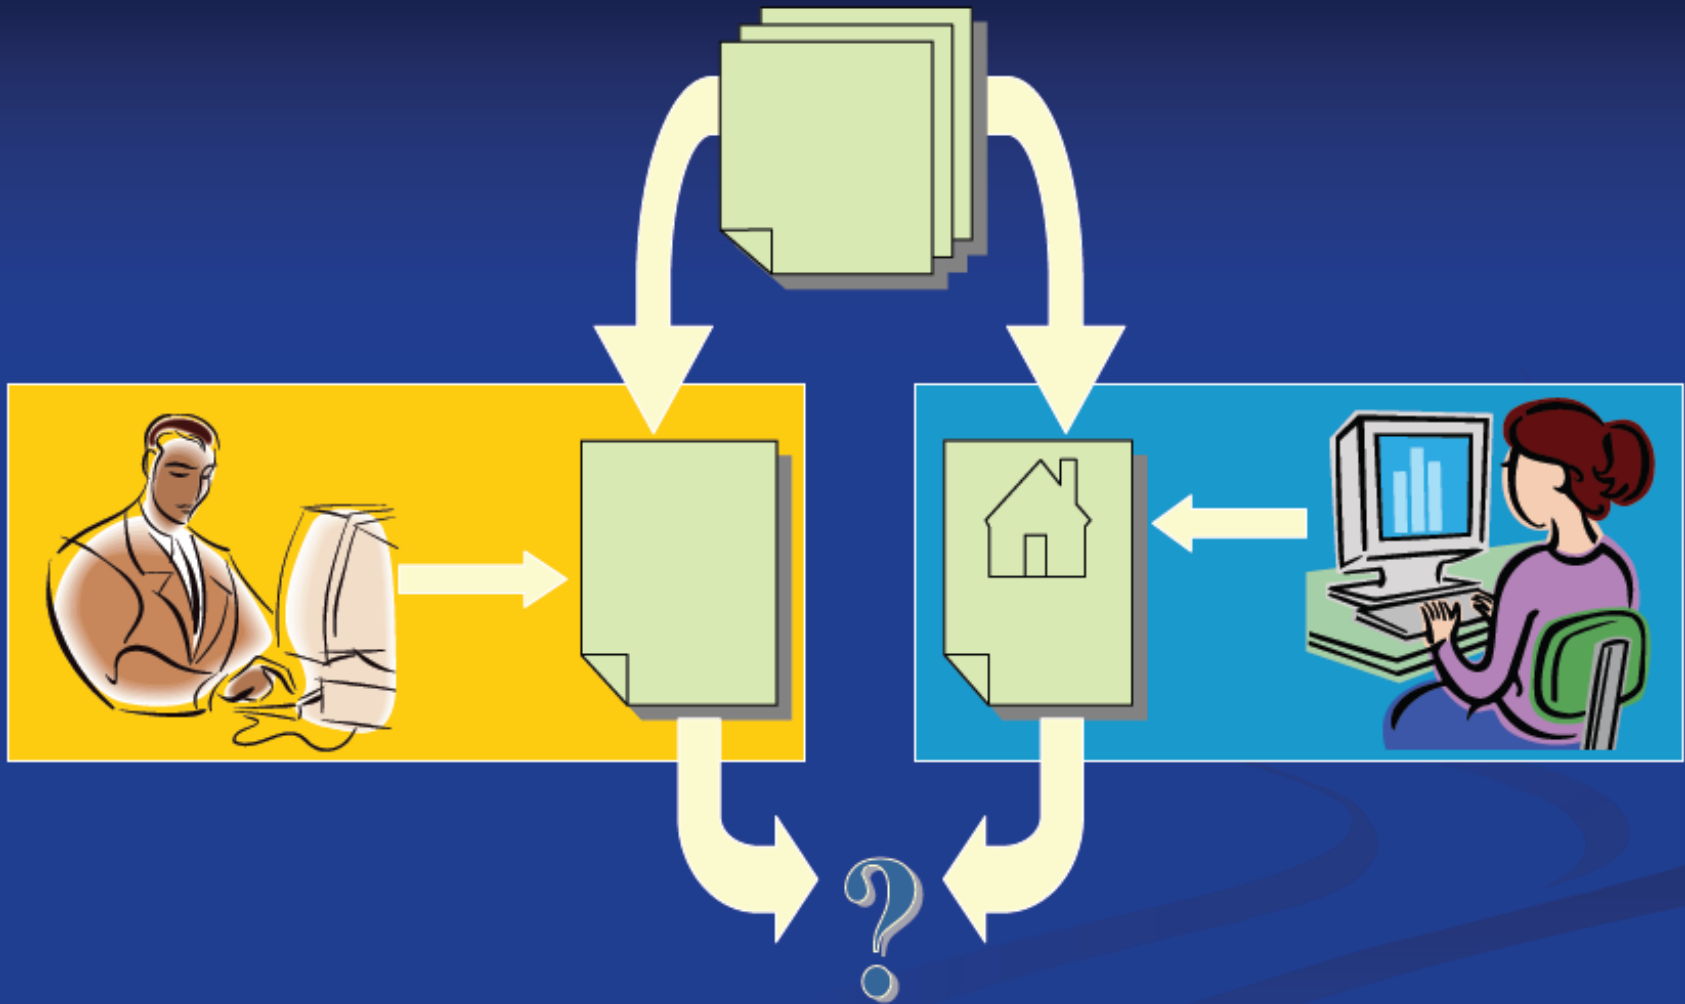

• ...

Now, On Tree Automata...

- We can compute
 - **Emptiness** of the represented set
 - Coinductively
 - **Intersection** between two sets
 - By Product Construction
 - $(Q, \delta) \cap (P, \gamma) = (Q \times P, \beta)$ where
 - $\beta((q, p)) =$
 $\{ (\sigma, (q_1, p_1) \dots (q_n, p_n)) \mid$
 $(\sigma, q_1 \dots q_n) \in \delta(q) \text{ and } (\sigma, p_1 \dots p_n) \in \gamma(p) \}$

Concurrent activities

Algorithm: “Coherence” check

- Given
 - Grammar $G = (S, A, P)$
 - View $V1$ and Forest $ts1$
 - View $V2$ and Forest $ts2$
- Are these two views coherent?
(i.e., can we “merge” them into a single document that generates the two views simultaneously?)

$\text{expansion}(V1,ts1,G,A) \cap \text{expansion}(V2,ts2,G,A) \neq \Phi?$

Algorithm: “Synchronization”

- Given
 - Grammar $G = (S, A, P)$
 - View $V1$ and Forest $ts1$
 - View $V2$ and Forest $ts2$
- How can we get the merged document?

→ If $\text{expansion}(V1, ts1, G, A) \cap \text{expansion}(V2, ts2, G, A)$

is a singleton set, that's it!

Otherwise, ambiguous → error

Singleton check

(Not in the paper...)

- Step 1 (Cleaning): $\mathcal{A} \rightsquigarrow \mathcal{A}_{cl}$
 - Eliminate all “failure” states and transitions
- Step 2 (Thinning): $\mathcal{A}_{cl} \rightsquigarrow \mathcal{A}_{cl,th}$
 - Determinize the automaton by dropping nondeterministic rules
- Step 3 (Equivalence Check) $\mathcal{A}_{cl} =? \mathcal{A}_{cl,th}$
 - Check Bisimilarity

Example 1

- ADDRESSBOOK \rightarrow @
- @ \rightarrow ε | PERSON @
- PERSON \rightarrow NAME ADDRESS TEL
- NAME \rightarrow ..., ADDRESS \rightarrow ..., TEL \rightarrow ...

- $V1 = \{\text{NAME}\}$
- $V2 = \{\text{TEL}\}$

- Example of a document: ADDRESSBOOK[@[
 - PERSON[
 - NAME[...] ADDRESS[...] TEL[...]
 -]@[
 - PERSON[
 - NAME[...] ADDRESS[...] TEL[...]
 -]@[]]]]

- expansion(V1, NAME[...]NAME[...])
 is consistent with
 expansion(V2, TEL[...]TEL[...])
 but not with
 expansion(V2, TEL[...]TEL[...]TEL[...])

Example 2

- ADDRESSBOOK \rightarrow @
- @ \rightarrow ε | PERSON @
- PERSON \rightarrow NAME ADDRESS TEL #
- # \rightarrow ε | TEL #
- NAME \rightarrow ..., ADDRESS \rightarrow ..., TEL \rightarrow ...

- V1 = {NAME}
- V2 = {TEL}

- Example of a document: ADDRESSBOOK[@[
 - PERSON[
 - NAME[...] ADDRESS[...] TEL[...] #[]
 -]@[
 - PERSON[
 - NAME[...] ADDRESS[...] TEL[...] #[TEL[...] #[]]
 -]@[]]]]

- expansion(V1, NAME[...]NAME[...])
 is consistent with
 expansion(V2, TEL[...]TEL[...])
and also with
 expansion(V2, TEL[...]TEL[...]TEL[...])

Ambiguity

- Example of a document: ADDRESSBOOK[@[
 - PERSON[
 - NAME[...] ADDRESS[...] #[TEL[...] #[]]
 -]@[
 - PERSON[
 - NAME[...] ADDRESS[...] #[TEL[...] #[TEL[...] #[]]
 -]@[[]]]]
- Ambiguity in the synchronization of expansion(V1, NAME[...]NAME[...]) with expansion(V2, TEL[...]TEL[...]TEL[...])

How to resolve ambiguity

- Be more careful in choosing views
 - Set of views that “covers” the whole structure
- Such as
 - $V1 = \{NAME\}$
 - $V2 = \{PERSON, TEL\}$

or

- $V1 = \{PERSON, NAME\}$
- $V2 = \{TEL, \#\}$

etc.

“Static” Singleton Checking?

- How can the merging system support users to choose appropriate views?
- For example, Given a set of views, can we check whether they cause ambiguity or not?
 - Undecidable Problem
(reduces to the ambiguity of CFG)
 - (No clear solution is given in the paper...)

Summary

- Synchronization of multiple (edited) views can be computed by using tree automaton
 - Compute inverse-image of the view
 - Compute intersection, emptiness, & singularity
- **Further topic** (in the paper, but not in this presentation)
 - “To-be-written” node
 - For each symbol X in the grammar, add \underline{X} and $\underline{X} \rightarrow \varepsilon$
 - Synchronizer allows X in u_2 to occur at \underline{X} position in u_1 , etc...

Automata as Coalgebra

- J.J.M.M. Rutten,
“Automata and Coinduction (An Exercise in Coalgebra)”, CONCUR 1998
 - The classical theory of deterministic automata is presented in terms of the notions of *homomorphism and bisimulation*, which are the cornerstones of the theory of (universal) coalgebra. This leads to a transparent and uniform presentation of automata theory and yields some new insights, amongst which *coinduction proof methods for language equality and language inclusion*. At the same time, the present treatment of automata theory may serve as an introduction to coalgebra.
